

Three evidence layers for future PAM deployment

Scientific learning and prediction validation remain separate; the public-facing layer is a display aid only.

A Coverage Expansion priority

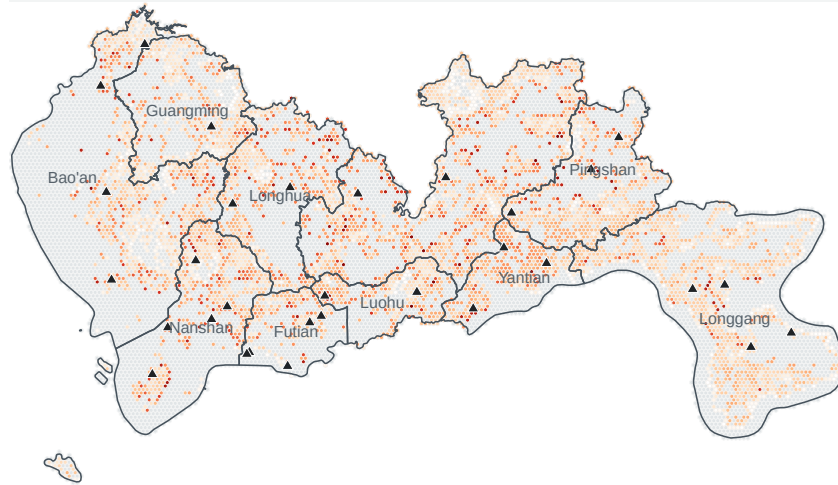

Prospective three-host AOA coverage gain in Monitoring Gaps

B Prediction Validation

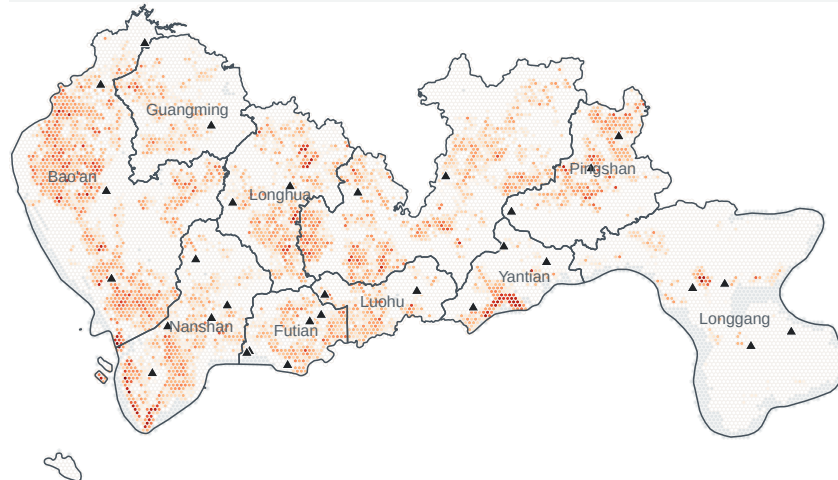

W15–W21 posterior uncertainty in

Primary Results + Moderate Extrapolation HEXes

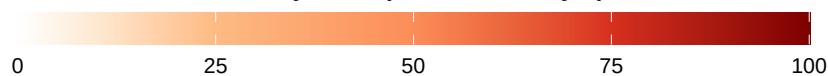

C Public-facing deployment display

Stronger scientific priority combined with mapped planning-sensitive context

Priority score (0–100 within layer)

Black triangles show the 31 existing PAM stations. Grey cells are outside the candidate pool for that panel; white eligible cells score 0. Scores are planning priorities, not ecological thresholds or exposure estimates.
